Recast

Add an Application to a Deployment Process

Last Modified on 2026-11-10

When you have selected new applications for your Recast Application Manager service, you need to apply them to a desired deployment process.

1. Open Application Manager and go to the **MECM Integration** tab.

2. Select the deployment process you want to use, or create a new one.

3. Select the new application for the deployment process and click **Apply.**

Application Manager will download and deploy the application automatically within 30 minutes, or you can download the application instantly by selecting **Start download** on the **Overview** tab.

> If you have self-created older versions of the chosen application in MECM, you need to remove deployments from those since Application Manager won't automatically supersede self-created applications.
