

# Add Service Connections

Last Modified on 04.26.23

Privilege Manager works with both Azure Active Directory and on-premises Active Directory joined devices. A service connection allows Privilege Manager to connect to, and query information from, Azure Active Directory. This service connection is automatically detected when [Recast Management Server is installed with Recast Proxy](#) .

For information on viewing, adding and managing service connections that link Recast Software infrastructure to third-party products in external environments, see [Service Connections](#).
