RECAST SOFTWARE

Software Updates Scan Cycle

Last Modified on 07.24.25

The **Software Updates Scan Cycle** launches a Windows Update Agent process where the client initiates a scan after software update installation to confirm that the update is no longer required. This action also creates a new state message that the update is installed.

> When installation completes but a restart is necessary, the state shows that the client computer is pending a restart.

This action can be run on single and multi-selected devices, or with a similar tool designed for device collections .

To run this tool:

1. Right-click on a device.

2. Select **Right Click Tools** > **Client Actions** > **Software Updates Scan Cycle** .

The window that opens displays progress and successful completion.
Recast Permissions

ConfigMgr Client	Software Updates Scan Cycle

Microsoft Permissions

- Requires that the target device has a working ConfigMgr client installed.
- Requires that the user running the ConfigMgr console has administrative access to the remote device.
- Remote WMI ports must be allowed through the firewall.
- If the 'Ping Computer Before Running Tools' option is set, ICMP Echo must be allowed through the firewall.
- If using a Recast Management Server with a proxy, the service account will need administrator permissions on the remote device.

> One way around some of the permissions requirements and firewall rules is installing a Recast Agent .
