

# Open Client Installation Log File Folder

Last Modified on 03.15.23

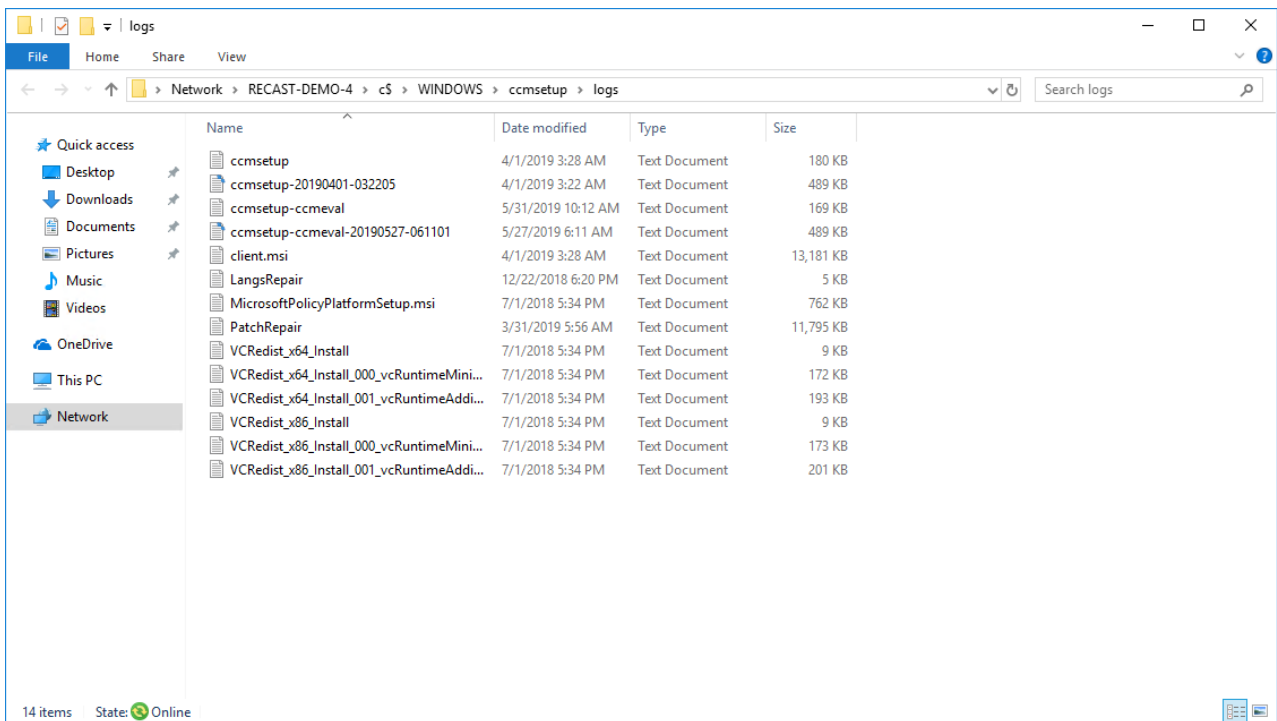

The **Open Client Installation Log Folder** tool allows a console user to open the file location of the client install log on a remote device. This tool can be run on single devices or multi-selected devices. This tool cannot currently be run on a device collection.

This tool completes this action via Filesystem.

To run this tool:

1. In your Configuration Manager console, right-click on a device.
2. Click **Right Click Tools > Client Tools > Open Client Installation Log Folder**.

The folder containing the client install log will open.

## Recast Permissions

|               |                |
|---------------|----------------|
| Local Actions | Open C\$ Share |
|---------------|----------------|

## Microsoft Permissions

This action runs using the credentials of the user signed into the Configuration Manager. That user requires permission to browse the C\$ Share on the remote device, which typically means that the user requires administrator permissions on the remote device. Permissions cannot be elevated with Recast Agent or Recast Proxy.

**NOTE:** This is the case even if using a Recast Server with a service account because this action launches an application outside of Recast. If the user does not have permission, a prompt will open asking for a username and password to try to successfully connect to the remote device.
