

Machine Policy Retrieval and Evaluation Cycle — Client Action on Collection

Last Modified on 11.28.22

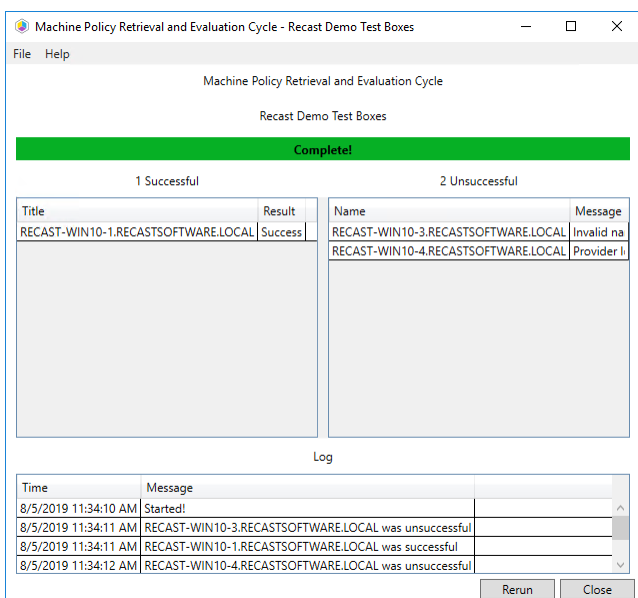

The **Machine Policy Retrieval and Evaluation Cycle** initiates policy retrieval from the client outside its scheduled polling interval. The default interval is 60 minutes. Triggering immediate policy retrieval is useful in a troubleshooting scenario or when testing.

This action can be run on device collections, or using a [similar tool designed for single and multi-selected devices](#).

To run this tool:

1. In your Configuration Manager console, right-click on a device.
2. Click **Right Click Tools > Client Actions on Collection > Machine Policy Retrieval and Evaluation Cycle**.

The window that opens displays progress and completion according to success.

Recast Permissions

- Requires the Machine Policy Retrieval and Evaluation Cycle permission on the ConfigMgr Client.

Microsoft Permissions

- Requires that the target device has a working ConfigMgr client installed.
- Requires that the user running the ConfigMgr console has administrative access to the remote device.
- [Remote WMI](#) ports must be allowed through the firewall.
- If the 'Ping Computer Before Running Tools' option is set, [ICMP Echo](#) must be allowed through the firewall.
- If using a Recast Management Server with a proxy, the service account will need administrator permissions on the remote device.

One way around some of the permissions requirements and firewall rules is installing a [Recast Agent](#).
