Install Missing Software Updates — Client Tool on Collection

Last Modified on 10.17.25

The Install Missing Software Updates tool displays required or available software updates that are not currently installed on a device, allowing a user to select and install them on a remote device.

This tool can be run on a device collection, or with asimilar tool designed to run on single and multi-selected devices

This tool will not deploy updates — it will install updates that have already been deployed

To run this tool:

- 1. Right-click on a device collection.
- 2. Select Right Click Tools > Client Tools on Collection > Install Missing Software Updates.

The Remote Software Center will open and start scanning for available or required Software Update Deployments.

3. Select desired updates and click Install.

Upon successfully kicking off the remote install, the Remote Software Center displays progress (of the kick-off, not the installation itself). Devices are sorted according to success.

Recast Permissions

SoftwareUpdates	ConfigMgr Client
-----------------	------------------

Microsoft Permissions

- This tool requires administrator permission on the remote device.
- If using a Recast Management Server with a proxy, the service account needs administrator permission on the remote device.
- This tool requires Remote WMI access.
