

# Configure a Recast Proxy for Management Tasks

Last Modified on 05.22.24

A Recast Proxy can be used to manage a number of tasks, such as allowing access to Right Click Tools [web dashboards](#), scheduling [Recast Builder actions](#) and [Kiosk Manager actions](#), and [collecting warranty information](#) with Endpoint Insights.

To set up a proxy to manage tasks:

1. [Authorize the proxy in the Recast Management Server](#) (if necessary).
2. [Create a Recast Proxy route](#) .
3. Reorder the routes to match your priorities (if desired).

By default, new routes appear at the bottom of the table on the **Routes** page. If you only need your proxy to populate scopes, and you don't want to [run any actions using that proxy](#), you can leave your proxy route at the bottom of the table. If you do reorder the proxy route list, click **Save** to finalize the changes.
