

# Invalid URI: The Hostname Could Not Be Parsed

Last Modified on 05.11.23

The **Invalid URI: The Hostname Could Not Be Parsed** error means that the desktop tools are configured with an invalid Recast Management Server URI. The default URI during installation is `https:///MobileToolsEnterprise.svc`, which is an invalid URI.

To fix this, you can either reinstall the Recast Desktop Tools specifying the URI during installation, or modify the registry value that the desktop tools use.

## Reinstall the Recast Right Click Tools

If you reinstall the desktop tools, the first screen in the installation wizard is the one you want to watch out for. In this screen, enter the Recast Management Server URI. You can also specify the Recast Management Server URI on the command line with the `RCTENTERPRISESERVER` MSI property.

## Modify the Registry

The desktop tools use the `ServerUri` value under `"\HKEY_LOCAL_MACHINE\SOFTWARE\WOW6432Node\Recast Software\Recast RCT"`. This value should be the Recast Management Server URI with port included. Example: `https://demo-rms-prod.demo.recastsoftware.com:444/`
