Recast Proxy Overview

Last Modified on 09.24.24

A Recast Proxy is a service that runs under a service account. A Proxy can serve many purposes, such as running Recast actions, elevating permissions, or reading from third-party services to populate scopes.

To view the required permissions for each Recast Software product and proxy use, see Proxy Permissions.

NOTE: In deployments with multiple Recast Proxies, only one Proxy can be installed per server, and each Proxy can only support one service account.
