Migrate Recast Management Server Database to a New Server

Last Modified on 03.02.26

Instructions for migrating your Recast Management Server database to a new server.

To migrate the RecastManagementServer database:

1. Back up your RecastManagementServer database.

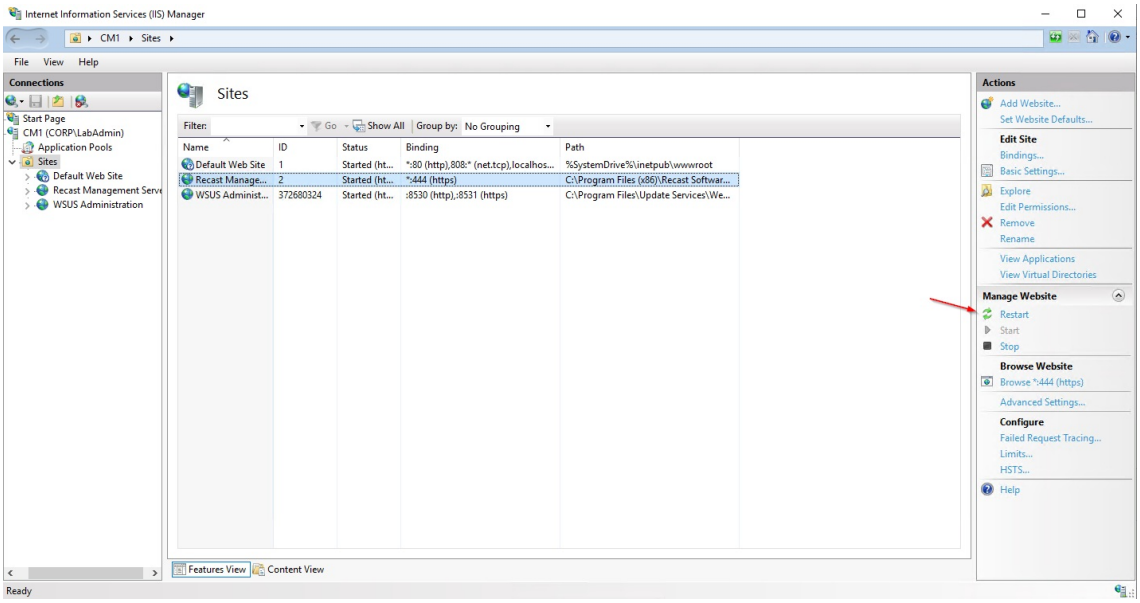
2. Copy the database over to the new location.

3. Navigate to `C:\Program Files (x86)\Recast Software\Recast Management Server` on your management server and open the **appsettings.Production.json** file.

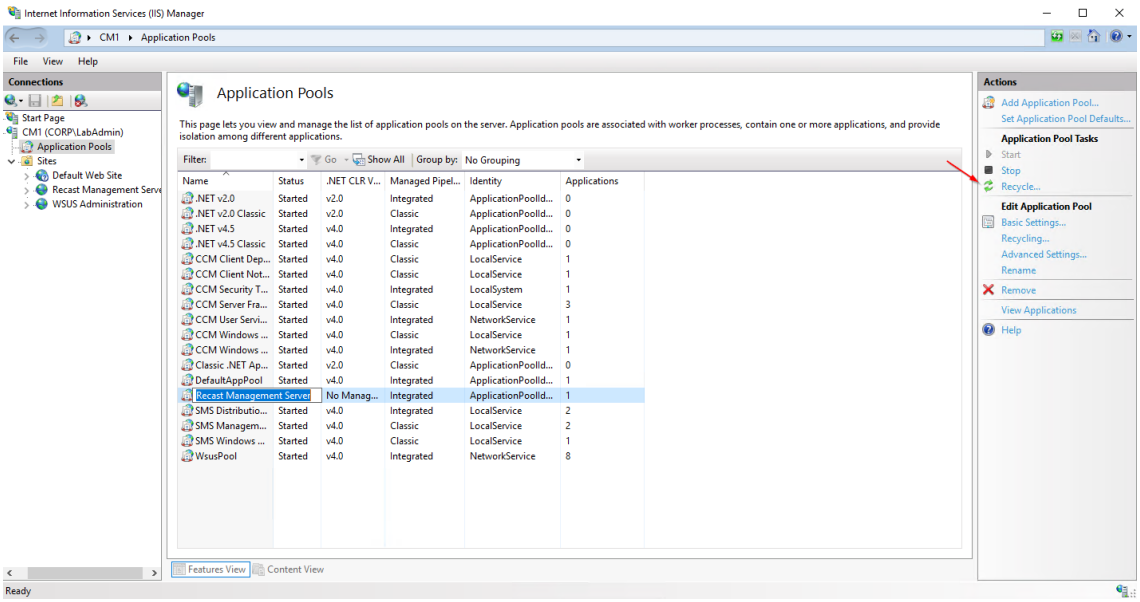
4. Update your server information in the .json file to specify the new server name.

```
{
        "ConnectionStrings": {
                "DefaultConnection": "Server=localhost;Database=RecastManagementServer;Trusted_Connection=True;MultipleActiveResultSets=true"
        }
}
```

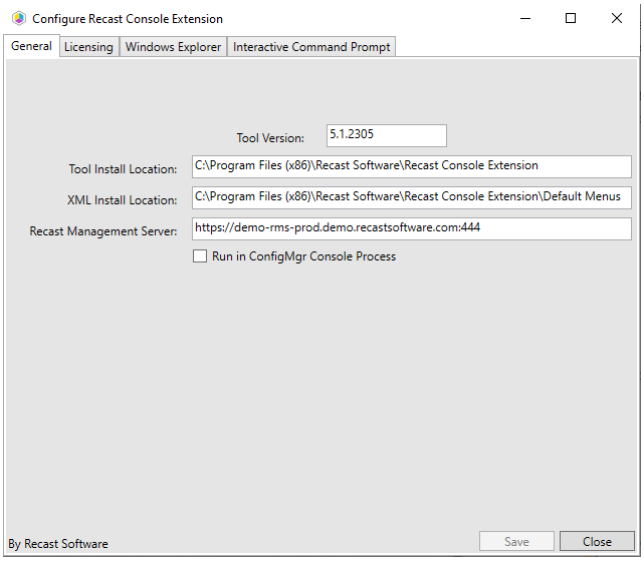
5. Open IIS Manager, under **Manage Website**, click to **Restart** your Recast Management Server website.



6. Under **Application Pool Tasks**, click **Recycle**.



7. If the name changes for the server, update any Right Click Tools installations to point to the new server by adding the **Recast Management Server** URL on the **General** tab in the Configure Recast Console Extension application.



8. If you have agents in your environment, update the **ServerUri** registry keys to point to the new server's name.
