## Deployment Launcher

Last Modified on 01.08.26

The **Deployment Launcher** lets you run Right Click Tools against devices in a particular deployment state. It can be used to force devices in an error state to rerun deployment, update policies, or add devices to a collection.

To run the Deployment Launcher:

1. In your Configuration Manager console, navigate to **Software Library > Overview > Application Management**.
2. Open **Applications, Packages or Software Updates**, depending on the type of deployment.
3. Select the **Deployments** tab at the bottom of the page.
4. Right-click on a deployment, then click **Right Click Tools > Client Actions on Deployment**.
5. Select a Right Click Tools action.
6. Select a status or statuses to run the action against.
