

## Deployment Launcher

Last Modified on 10.14.25

The Deployment Launcher lets you run Right Click Tools against devices in a particular deployment state. It can be used to force devices in an error state to rerun deployment, update policies, or add devices to a collection.

To run the Deployment Launcher:

- 1. In your Configuration Manager console, navigate to Software Library > Overview > Application Management.
- 2. Open Applications, Packages or Software Updates, depending on the type of deployment.
- 3. Select the **Deployments** tab at the bottom of the page.
- 4. Right-click on a deployment, then click Right Click Tools > Client Actions on Deployment
- 5. Select a Right Click Tools action.
- 6. Select a status or statuses to run the action against.
