Credential Provider Configuration

Credential provider settings are stored in the Windows Registry at `HKEY_LOCAL_MACHINE\Centero\Agent\Modules\Carillon` .

Usage scenario

Credential provider can be enabled independently on the login page and in the UAC prompt.

Set the **Credential provider usage scenario** to

- 0 for logon / lock workstation screen
- 1 for UAC prompt
- 2 for both

Activation types

The credential provider can be used with three different activation types. The following settings are DWORD values, where **0** disables and **1** enables the corresponding activation type.

The default (pre-selected) activation type is configured with **Credential provider default activation type** where

- 1 = activation code
- 2 = local account
- 4 = domain account

Activation code

Credential provider shows use activation code

Run with local account

Credential provider shows run with local account

> **Note**: **Run with local account** is always disabled on the login page, regardless of this setting.

Run with domain account

Credential provider shows run with domain account

> **Note**: **Run with domain account** is always disabled on the login page and UAC prompt when **Run as different user** is used, regardless of this setting.
