

Create a Local Group

You can add a managed local group by creating management rules for the group. Local groups will only be created for the Recast Privilege Manager database so that you can use the group when creating management rules to specify members of the group on computer(s).

The screenshot shows a dialog box titled "Privilege Manager" with a close button (X) in the top right corner. On the left is a group icon. The main text reads: "Select category for the group. Specify a name for the local group that you want to managed. You can manage only local groups on computers. Optionally you can specify a display name that will be shown on Privilege Manager and/or description for". Below this are four input fields: "Category:" with a dropdown menu showing "(none)", "Name:" with the text "Application 1 Admins", "Display name:" with the text "Application 1 Administrat", and "Description:" with the text "Admins for app 1". At the bottom right are "Add" and "Cancel" buttons. A status bar at the bottom left says "Window loaded."

To create a local group:

1. Select the **Category** in which the local group will be created and shown. The category does not affect the local group usage. Category selection is purely for organizing local group to make it easier to find when creating management rules.
2. Enter a **Name** for the local group. This will be the actual group name, for example COMPUTER1\Application 1Admins.
3. Enter a **Display name** for the group. If the display name is not specified, the **Name** is used as the display name.
4. Enter a **Description** of the group, if required.
5. Click **Add**.
