

Modify an Unmanaged Account Rule

Last Modified on 08.08.25

You can change the validity time, password and rule status configuration on existing unmanaged account rules.

1. Rule target

You can see the computer name where the rule is targeted. Verify that you are modifying the correct rule.

2. Validity time

You can set a specific amount of time during which an unmanaged account rule will be valid. The validity time applies to both rules for an unmanaged account (managed user and managed group rules). The maximum validity time is determined by the Recast Privilege Manager Administrator.

This field is only available if enabled by the Recast Privilege Manager administrator. See more information in the **Recast Privilege Manager Administration Guide**.

3. Password

If an unmanaged account password needs to be reset, specify a new password for the unmanaged account or click the **Reset password** button to generate a new random password. The existing password for unmanaged accounts are not known and cannot be retrieved anywhere.

4. Change unmanaged account rule

Modify the existing unmanaged account rule. If the unmanaged account rule was modified, the window will be automatically closed.
