

Reset Passwords

Last Modified on 02.06.23

If an administrator has allowed all randomly generated passwords to be regenerated then the Reset password tab is shown. Resetting all passwords will cause all Privilege Manager Clients to regenerate all randomly generated passwords when the next Agent Gateway connection is established.

The screenshot shows the 'PRIVILEGE MANAGER' interface with a navigation bar containing 'Frontpage', 'Configuration', 'Reporting', and 'Service Desk'. A sidebar on the left has three items: 'Retrieve password', 'Reset passwords' (marked with a blue circle '1'), and 'Reset all passwords' (marked with a blue circle '2'). The main content area is titled 'Retrieve password for local user account' and features a shield icon with a keyhole. The text explains that domain and computer name information from the Privilege Manager client is needed to retrieve passwords for local user accounts. It also notes that only user accounts specified in the Privilege Manager to save randomly generated passwords to the database are shown, and that passwords cannot be retrieved for other local user accounts.

Password Reset Functions

Reset passwords: Regenerates all randomly generated passwords on all Privilege Manager Clients. This permission needs to be allowed by your Recast Privilege Manager Administrator.

Reset all passwords: Forces regeneration of all random passwords in the Recast Privilege Manager environment.
