

Change Database

If your Privilege Manager environment is configured to connect to several Privilege Manager databases, this page allows you to connect your Recast Privilege Manager portal to the selected database. The available databases can be configured in web.config file. For more information, see [web.config](#).

The screenshot shows a dark header bar with the text "PRIVILEGE MANAGER" on the left and a "Help" icon on the right. Below the header, there is a form with the label "Select database connection for Privilege Manager". The form contains a dropdown menu with "Default" selected and a "Select" button to its right.

To change the connected database:

1. Select desired database.
2. Connect the Privilege Manager portal to the selected database.
