Logged On User Has Permissions To Use Self-service

Starting from Recast Privilege Manager client version 3.0.5000, the temporary user account activation process can be done directly from the credential provider. The Privilege Manager administrator can limit self-service for specific users (like service desk personnel) and then users activating temporary user account must specify their own domain account credentials to use self-service.

When actions requiring administrator level permissions are executed or the user selects **Run as different user** to execute an action, Windows by default shows a User Account Control window where credentials are provided to execute the action. This User Account Control has a Recast Privilege Manager option for when the credential provider has been installed on the client.

In the User Account Control dialog, click **More choices** to show the Recast Privilege Manager credential provider.

1. Click **Recast Privilege Manager** to select the **Privilege Manager** credential provider.

2. Select **Run with local account** from the drop-down list.

3. If more than one temporary user account is available, select the desired temporary account from the drop-down list.

4. Specify the reason a temporary account is required.

5. Click **Yes** to run the action with a temporary user account.
