

Client Actions on Collection

Last Modified on 05.19.23

Application Deployment Evaluation Cycle — Client Action on Collection

Re-evaluates the requirement rules for all deployments. For applications that are required but not installed, prompts ConfigMgr to trigger a re-install.

Discovery Data Collection Cycle — Client Action on Collection

Prompts the client to generate a new discovery data record (DDR).

File Collection Cycle — Client Action on Collection

When a file is set for collection, the Configuration Manager software inventory agent searches for the specified file when it runs a software inventory scan on each client.

Hardware Inventory Cycle — Client Action on Collection

Collects data such as available disk space, processor type, and operating system for each device.

Machine Policy Retrieval and Evaluation Cycle — Client Action on Collection

Initiates ad-hoc policy retrieval from the client outside its scheduled polling interval.

Send Unsent State Messages — Client Action on Collection

Sends state messages cached on the ConfigMgr client to the ConfigMgr server.

Software Inventory Cycle — Client Action on Collection

Collects software inventory data directly by inventorying file header information.

Software Metering Usage Report Cycle — Client Action on Collection

Collects data for monitoring client software usage.

Software Updates Deployment Evaluation Cycle — Client Action on Collection

Initiates a scan for software updates compliance.

Software Updates Scan Cycle — Client Action on Collection

Initiates a scan just after a software update installation to confirm that the update is no longer required and creates a new state message that the update has been installed.

State Message Cache Cleanup — Client Action on Collection

Clears state messages that are cached on the ConfigMgr Client.

Windows Installer Source List Update Cycle — Client Action on Collection

Prompts the Product Source Update Manager to complete a full update cycle.
