

Application Manager Legacy Platform Description

Last Modified on 11.20.25

Application Manager Legacy's platform is comprised of third-party platform services, in which the third-party service provider is responsible for the platform's functionality. Different Application Manager products and their individual features use either all or some of the platform services.

The information within the Application Manager service is always encrypted when transferred using a public network. The platforms used in providing the service utilize the platform's encryption features, wherever deemed necessary and possible.

If the Customer uses an Application Manager product with the Application Manager Integration Client installed in the customer's own environment, the customer is responsible for the procedures required by the environment in question, and the Application Manager Integration Client.
