Application Manager for WSUS Description

Last Modified on 12.01.25

Application Manager for WSUS integrates into the customer's Windows Server Update Services (WSUS) service. The integration is done through the Client Software and Application Manager background services.

The WSUS service deploys the desired Applications on the workstations that are members of WSUS and its groups.

Recast Software is not responsible for the customer's WSUS service's operation. Instead, it's the customer's responsibility to take care of the service's operation, any related platform services, and the necessary connections to AM background services.

The customer is also responsible for deploying the Client software, and the necessary connections to background services.
