

Application Manager Packages

Last Modified on 06.15.23

In the Application Manager Packages service, the Customer is only granted access to the manual use of the AM applications selected to the service. The packages can be downloaded from the Portal, requested from [our support team](#), or downloaded to the desired location using AM Integration Client.

With this Service, the application deployment cannot be automated. The Customer is responsible for deploying the installation packages to the target devices.

Any device in the domain of this Service needs another AM product to connect it to AM. Alternatively, the Customer and the Provider can draw up a separate, written agreement on the user rights.

Application Package Modifications

Application packages are modified to ensure compatibility in organizational use. The modifications depend on the individual application, but the most common changes include:

- Disabling automatic updates
 - Disabling usage data collection
 - No desktop shortcuts
 - Disabling popup messages
-
