

Configuration Manager Setup

Last Modified on 11.17.23

Before installing Application Manager, you'll need to set up the following in your Configuration Manager environment:

- Distribution Point Groups
- Collections
- Application Root Folder

Set Up Distribution Point Groups

Application Manager targets application content to distribution point groups. You must have or create at least one distribution point group in Configuration Manager before installing Application Manager. You might want to include all distribution points in your distribution point group, but in larger environments it's possible to include only distribution points used for application media distribution. You can use existing distribution point groups in Application Manager.

To create a new distribution point group:

- 1. In your Configuration Manager console, navigate to **Administration** > **Distribution Point Groups**.
- 2. In the upper left-hand corner, click **Create Group**.

I - Centero)				×
				~ (

3. In the window that opens, specify a **Name** for the distribution point group.

4. On the **Members** tab, select the distribution points where content should be distributed by Configuration Manager when new applications are created by Application Manager and click **OK**.

Set Up Collections

Device and user collections are used as a deployment target in Application Manager's deployment processes. You can create collections in your Configuration Manager console by navigating to **Assets and Compliance** > **Device Collections** or **User collections**.

If you are using Application Manager to deploy all your selected applications to all of your devices, which is most common, you only need two collections — Pilot & Production.

Create an Application-Specific Collection

To deploy an AM-created application to only those devices containing a previous version of the application, you can create application-specific collections in Configuration Manager by using queries. After the collection is created, add it to an application-specific deployment process in Application Manager.

- In addition to deploying an application to an application-specific collection as a Required deployment, you can also create an Available deployment for the rest of your devices.
- If the newly created collection is not visible in Application Manager, click the green Refresh icon next to the **Collection name** drop-down menu.

Example:

Overview MECM Integration Settings Email	Templates Scheduled Tasks		
Deployment processes ↓ ↓ ↓ ↓ ↓ ↓ ↓ ↓ ↓ ↓	Software selection General sett Collections	ings Application settings Deployment type settings	Deployment settings

	Make deployment available	◯ Immediately	on any working day \checkmark at any time \checkmark
	And force installation	Immediately after working days	on v at v

To configure an application-specific query for a collection:

1. On the **Membership Rules** page in the device or user collections wizard, add a query rule to a collection.

2. Under Query Rule Properties, click Edit Query Statement.

3. On the **Criteria** tab, add new criteria and select **Installed Software** > **Product Name**. Add the application name to the **Value** field with percentage symbols around it (%APPLICATION%).

💱 Create Device Collection	Wizard	×
Membership Ru	les	Query Rule Properties X

Example queries for application-specific collections

You can also use our example queries as listed below. Add a WQL query by selecting **Show Query Language** in the **Query Statement Properties** window.

TIP: You can determine an application's exact product name in your Configuration Manager console by selecting a device with the application installed and going to **Resource Explorer** > **Installed Software.**

Mozilla Firefox

select * from SMS_R_System inner join SMS_G_System_INSTALLED_SOFTWARE on SMS_G_System_INSTALLED_SOFT WARE.ResourceId = SMS_R_System.ResourceId where SMS_G_System_INSTALLED_SOFTWARE.ProductName = "Firefo x x64"

Google Chrome

select * from SMS_R_System inner join SMS_G_System_INSTALLED_SOFTWARE on SMS_G_System_INSTALLED_SOFT WARE.ResourceId = SMS_R_System.ResourceId where SMS_G_System_INSTALLED_SOFTWARE.ProductName = "Googl e Chrome (64-bit)"

Adobe Reader DC

select * from SMS_R_System inner join SMS_G_System_INSTALLED_SOFTWARE on SMS_G_System_INSTALLED_SOFT WARE.ResourceId = SMS_R_System.ResourceId where SMS_G_System_INSTALLED_SOFTWARE.ProductName = "Adobe Acrobat Reader DC (64-bit)"

If the product name includes a version

select SMS_R_System.ResourceId, SMS_R_System.ResourceType, SMS_R_System.Name, SMS_R_System.SMSUniqueld entifier, SMS_R_System.ResourceDomainORWorkgroup, SMS_R_System.Client from SMS_R_System inner join SMS_G_System_INSTALLED_SOFTWARE on SMS_G_System_INSTALLED_SOFTWARE.ResourceID = SMS_R_System.ResourceId where SMS_G_System_INSTALLED_SOFTWARE.ProductName like "rproduct name>%"

Set Up An Application Root Folder

Application Manager will create a folder structure for Configuration Manager in **Software Library** > **Application Management** > **Applications**. You can specify the root folder name that will be created under **Applications**. All applications added by AM will be created under this root folder with the following structure: Publisher > Application name. By default, the root folder name is **Application Manager**, but you can change this in the deployment process settings.
