

Add an Application to a Deployment Process

Last Modified on 03.23.23

When you have [selected new applications](#) for your Recast Application Manager service, you need to apply them to a desired deployment process.

1. Open Application Manager and go to the **MECM Integration** tab.
2. Select the deployment process you want to use, or create a new one.
3. Select the new application for the deployment process and click **Apply**.

Application Manager will download and deploy the application automatically within 30 minutes, or you can download the application instantly by selecting **Start download** on the **Overview** tab.

If you have self-created older versions of the chosen application in MECM, you need to remove deployments from those since Application Manager won't automatically supersede self-created applications.
