Remove Retired Applications Automatically

By default, Application Manager leaves old application versions to retired state in Configuration Manager. You can set Application Manager to remove old application versions from Configuration Manager and from its content source.

To automatically remove old application versions:

1. Open Application Manager and go to the **MECM Integration** page.

2. Select a deployment process and go to the **Application settings** tab and change the value of **Retired cleanup** setting to **Remove retired applications and media.**

   - Change the value to your other deployment processes if you have multiple deployment processes in Application Manager.

Once the setting is configured, old application versions will be automatically removed when the next version of the application is published.

> **NOTE**: The Cleanup feature will remove only Application Manager-created applications.
