

Application Naming

Last Modified on 12.08.22

Application Manager can be configured to set an application name in a desired format. By default, the name contains the application's publisher, name, version, language and architecture. An application description can be also defined in AM.

The application name can be configured with tags (listed below) or with normal text. You can configure a naming scheme on the **Deployment Processes > Application settings** tab.

Default values

- **Application Name:** [PUBLISHER] [NAME] [VERSION] [LANGUAGE] [ARCHITECTURE]
- **Application Description:** [PUBLISHER] [NAME] [VERSION] [LANGUAGE] [ARCHITECTURE] ([INSTALLERTYPE])
