# Application Manager for MECM FAQ

Last Modified on 11.17.23

**I added a new collection to a deployment process - why I can't see the new deployment in Configuration Manager?**

When you make changes or add new collections to a deployment process in Application Manager, the changes will not take effect until the next version of the application selected to the deployment process is published by Recast. You can re-import the application to Configuration Manager if you want to deploy the latest version of the application with new settings.

See instructions for re-importing applications.

**How often does Application Manager check for new application versions?**

Application Manager checks for new application versions every 30 minutes by default. Click **Start download** on the Application Manager homepage to check and download new versions instantly.

**How do I deploy an application only to devices with a previous version installed?**

Application Manager created applications will be installed to all devices or users in a target collection whether or not there are previous versions installed. If you want to install an application only to devices with a previous version installed, create a collection and search for target devices with a query. Use the collection as your main deployment target.

See instructions for creating collections with an application query .

**We are moving our environment from Configuration Manager to Intune. Can we use Application Manager for MECM and Application Manager for Intune at the same time?**

Yes, you can!

**Can AM remove old applications automatically from Configuration Manager?**

Yes.
