

Uninstall Application Manager for WSUS

Last Modified on 08.25.23

To uninstall Application Manager for WSUS:

1. Remove the applications brought by Application Manager from your AM for WSUS console. Remove all installation approvals.
2. Go to **Programs and Features**, select **Recast Application** Manager Integration Client and uninstall it.
3. Terminate the Application Manager for WSUS service by going to <https://am.recastsoftware.com> and navigating to **Administration > Services**.

Make sure that you have a plan for updating or removing the AM-supported applications from endpoints. All the applications distributed with the Application Manager service will have their built-in update system disabled, which means that if you have no other tool or method to update the apps, they will not be updated.
