

## Privileged Access Implementation Workflow

Last Modified on 2026-06-29

Once you've ensured that your system meets [Recast Management Server requirements](#), deploy Privileged Access and the required Recast components according to this implementation workflow.

### Recommended workflow for installing Privileged Access

1. Download the following Recast components from the [Recast Customer Portal](#):

- Recast Management Server
- Recast Proxy, if using Active Directory or Entra ID objects to target rules
- Recast Agent

2. Install [Recast Management Server with Recast Proxy](#).

**NOTE:** The Recast Proxy must be deployed separately, after [Recast Management Server installation](#), only if the proxy is being installed on a server other than the Recast Management Server. See [Install Recast Proxy Separately](#).

If you've already installed a Recast Management Server with a Recast Proxy for Right Click Tools, Insights, or Patching, there's no need to reinstall RMS and Proxy to add Privileged Access.

Also, a [Recast Agent Gateway](#) is automatically deployed and authorized when you install a Recast Management Server.

3. Set up [Recast Management Server roles and permissions for Privileged Access](#)

4. Set up [Entra ID for Privileged Access](#).

5. Set up your default Privileged Access configuration

6. Deploy the Recast Agent application.
