Target Group Overview

Target groups refer to the set of devices on which particular Privilege Manager rules are applied. By default, there is one target group that includes all devices. You can also build target groups that direct rules to a broad or narrow subset of devices, or even to a single device. Target groups can be based on Active Directory domains, organization units, groups, and single agents or devices. They can also be built from Azure Active Directory tenants, groups, and single agents or devices.

During your initial Privilege Manager setup, you create target groups by choosing devices. After defining your default Privilege Manager configuration, you can view, add, edit, and delete the target groups that will follow your management rules on the **Target Groups** page. This is also where you can edit client settings, including passwords, associated with a target group.
