

Recast Proxy

Last Modified on 11.27.25

A Recast Proxy is a service that runs under a service account.

Proxy Uses

- Running Recast actions
- Elevating permissions
- Reading from third-party services to populate limiting rules

To view the required permissions for each Recast Software product/add-on and proxy use, seeProxy Permissions.

In deployments with multiple Recast Proxies, only one Proxy can be installed per server, and each Proxy can only support one service account.

Proxy Types

User Proxies are automatically installed with your standard Right Click Tools installation. The user proxy ensures that actions run in Right Click Tools will run as the logged in user with the logged in user's permissions. User proxies do not appear on the Recast Proxies page in the Recast Management Server interface.

Service Account Proxies are useful when you want to run actions as a service account. These can also be used to run actions against untrusted domains. Install these proxies using the Recast Proxy installer available in the Recast Portal. Service account proxies are listed on the Recast Proxies page in RMS.

Service account proxies installed in another domain than the Recast Management Server must be manually authorized on the Recast Proxies page before they can be used to run actions. You can also edit RMS settings to automatically approve all proxies.

Proxy Permissions

The permission set required for a proxy service account differs depending on how you're using a Recast Proxy.

If you haven't set up the required proxy permissions prior to installing Recast Management Server or Recast Proxy, you can skip the installer's Configuration Manager Configuration page by removing any information from the text fields, selecting Test ConfigMgr Connection and the Skip ConfigMgr Verification checkbox, and clicking Next.

Right Click Tools

Access web dashboards and trends Schedule Builder actions Schedule kiosk profile application	 Local admin access on the server where the proxy is being installed Read permissions in Active Directory db_datareader in the Configuration Manager SQL server database Read-only access to the Configuration Manager console (Read-only Analyst security role in ConfigMgr)
Run actions as a service account	 Local admin access on any device that actions will be run against Read/Write permissions in Active Directory (Write only required to delete devices from AD) Appropriate ConfigMgr Security Role for intended actions in the Configuration Manager console (Full Administrator for all actions) Permission to MBAM, if applicable
Elevate permissions	Local admin access on all devices managed by Right Click Tools
Add or remove from collections	Permission to modify a collection in Configuration Manager configmgr collection > modify permission
Fast Channel support	 Permission to run scripts in Configuration Manager If using Read-only Analyst in ConfigMgr as your base security role, also grant the following privileges: Collection > Run Script = Yes SMS Scripts > Read = True

Right Click Tools Insights

Collect warranty information	 Local admin access on the server where the proxy is being installed Read permissions in Active Directory db_datareader in the Configuration Manager SQL server database Read-only access to the Configuration Manager console (Read-only 				
	 Analyst security role in ConfigMgr) NOTE: These permissions match those required to access web dashboard and trends in Right Click Tools Internet access for the proxy account in order for the Recast Managemer Server to reach our API at https://warranty.recastsoftware.com over TCP 443 				
Collect warranty information if RMS is installed on a server other than your ConfigMgr SQL database	 Add proxy account to the SMS_SiteSystemToSiteServerConnection_MP_<yoursitecode> local group on that server, allowing it to read/write to your inboxes\auth\ddm.box</yoursitecode> 				

Right Click Tools Privileged Access

NOTE: Privileged Access does not require a Configuration Manager service connection.

For all Privileged Access features	Local admin on the server where the proxy is being installedRead permissions in Active Directory
	• head permissions in Active Directory

Right Click Tools Patching

Configuration Manager Integration	 Grant any of the following built-in roles/role combinations to the proxy account: Full Administrator Operations Administrator Application Administrator and Compliance Settings Manager Application Administrator and Read-only Analyst Grant modify permissions to the SMB share (UNC path) that will be used to store downloaded applications Access to the necessary external domains. See System Requirements.
Intune Integration	 Grant modify permissions to the SMB share (UNC path) that will be used to store downloaded applications Access to the necessary external domains. See System Requirements.
Software Updates in ConfigMgr	 Add proxy account as a member of the WSUS Administrators on the server where WSUS connected to ConfigMgr is located Add proxy account as a member of the local Administrators group on the WSUS server. If security policies does not allow this, you can work around the requirement by granting the proxy account full control over specific items that allow package publishing. Install the RSAT Windows Server Update Services Tools feature on the Recast Proxy server and restart the Recast Proxy service. PowerShell command: Install-WindowsFeature -Name UpdateServices-RSAT IncludeAllSubFeature

NOTE: Group Managed Service Accounts (gMSAs) are not currently supported.

Install a Recast Proxy

You can install a service account proxy on the same physical or virtual server as the Recast Management Server and/or a Recast Agent Gateway. It's possible to add a Recast Proxy during or after Recast Management Server installation.

If the proxy is being installed in a different domain than the Recast Management Server, the Recast Proxy must be deployed separately after Recast Management Server installation See Install Recast Proxy Separately.

Authorize a Proxy

By default, the Recast Management Server automatically authorizes any Recast Proxy installed in the same domain as the Recast Management Server. Proxies installed in other domains must be approved manually, unless you've edited the default setting to approve all proxies automatically.

Approve or Un-approve a Proxy Manually

If a proxy is installed separately in another domain, you must approve it manually.

To approve a proxy manually:

- 1. On the Recast Proxies page in your Recast Management Server, find your newly installed proxy. It should be visible but not Authorized.
- 2. Click the Edit icon to the right of the proxy.
- 3. In the Edit window, enable or disable the Authorized checkbox and click Update.

Recast Proxies								
Computer Name	T	Connected	T	Version Y	Authorized	T	Actions	
DEV1-RMSPROX-01		~		5.8.2501.1312	~		/ Î	•
DEV2-RMSPROX-01		~		5.8.2501.1312	~		/ i	
DEV3-RMSPROX-01		~		5.8.2501.1312	~		/	•

Approve All Proxies Automatically

You can choose to have your Recast Management Server automatically authorize all proxies regardless of the domain where they're installed.

To approve all proxies automatically:

- 1. In your Recast Management Server, navigate to Administration > Settings.
- 2. Under Recast Management Server, click the Edit icon to the right of Recast Proxy Approval.
- 3. In the Change Setting window, choose Automatically Approve All Agents from the Value drop-down menu.

Create a Proxy Route

A route determines the proxy to which your Recast actions are sent. In order for the Recast Management Server to run actions through the service account proxy, create a proxy route that uses the service account.

To create a Recast Proxy route:

- 1. On the Routes page in your Recast Management Server, click Create.
- 2. In the Create Route window, set the route Type to 'Recast Proxy'.
- 3. Select your proxy computer name with service account from the drop-down.
- 4. Set the Role to 'Administrators'.
- 5. Click Submit.

Run Actions as a Service Account with Recast Proxy

Once you've created a proxy route, you can direct Recast actions to it.

By default, new routes appear at the bottom of the table on the Routes page. To make actions run using a Recast Proxy route that is lower in the list, you must move that route above the Console Extension route in the table, as the first route to be successfully matched will be used.

To reorder routes, drag and drop them into the desired order. When you're done reordering the proxy route list, clickSave to finalize the changes.

Configure a Recast Proxy for Management Tasks

A Recast Proxy can be used to manage a number of tasks, such as allowing access to Right Click Toolsweb dashboards, scheduling Recast Builder actions and Kiosk Manager actions, and collecting warranty information with Endpoint Insights.

To set up a proxy to manage tasks:

- 1. Authorize the proxy in the Recast Management Server (if necessary).
- 2. Create a Recast Proxy route.
- 3. Reorder the routes to match your priorities (if desired).

By default, new routes appear at the bottom of the table on the Routes page. If you only need your proxy to populate limiting rules, and you don't want torun any actions using that proxy, you can leave your proxy route at the bottom of the table. Changes to the route order are saved automatically.
