

# Map Target Input Parameters

Last Modified on 06.18.24

Parameters can be mapped to a constant value or a specific property or step. **Constant** values must be specified, whereas **Parameter Mapping** values can be pulled from any step of the existing tool to any property of the action being taken. This should be done for every parameter appropriate for the actions you are trying to take.

- Use a Constant value to hard code a value.
- Use Parameter Mapping for actions where you need to pull inputs from the user or where the properties of the object should change.

To map to a constant value:

Under **Target Input Parameters**, select **Constant**.

The screenshot shows a configuration window titled "Selected Edge". On the left, under "Target Input Parameters", there are three rows: "SAM Account Name", "Domain", and "Group". The "SAM Account Name" row has a dropdown menu set to "Constant". The "Domain" row has a dropdown menu set to "Constant". The "Group" row has a dropdown menu set to "Parameter Mapping". To the right of these is a "Condition" section with a dropdown menu and an "Add Condition" button. Below the "Condition" section are three input fields labeled "Output", "Condition", and "Value". At the bottom left of the window is a "Remove Edge" button. At the bottom of the window is a "Selected Item Properties" section.

To map to a property or step:

Under **Target Input Parameters**, select **Parameter Mapping**, then select the **Node** and the **Parameter** from the drop-down lists.

The screenshot shows the same configuration window as above. In this view, the "SAM Account Name" dropdown is set to "Parameter Mapping". The "Domain" dropdown is set to "Node:" and the "Group" dropdown is set to "Param:". Below these dropdowns, there are two options: "( Start Node )" and "( Add Account to Group )". The "Output", "Condition", and "Value" fields are empty. The "Remove Edge" button and "Selected Item Properties" section are also visible.
