

No Such Interface Supported Error

Last Modified on 07.25.23

A **No such interface supported** error may be thrown by the local Windows Management Instrumentation (WMI) Service if you attempt to access functions from a host that blocks WMI requests or where there is a firewall between hosts. You can use the Windows Management Instrumentation Tester (WBEMTEST) to check if WMI access is being restricted on a remote host.

To verify the error:

1. From the Windows Start menu, open **Run**.
2. Enter 'wbemtest' and click **OK** to open the Windows Management Instrumentation Tester.
3. Click **Connect**.
4. In the **Namespace** field, enter `\\<HOSTNAME>\root\cimv2`, where HOSTNAME is the name of the remote server throwing the error. If either device is on a different domain or within a workgroup, specify administrator credentials for the domain or remote computer.
5. Click **Connect**. If WMI access is restricted, the **No such interface supported** error should appear.

For more information about WMI setup, see:
