RECAST SOFTWARE

Additional Installation Parameters

Last Modified on 03.25.25

Installation/Uninstallation Parameters

Additional Installation Parameters or **Additional Uninstallation Parameters** can be appended to the default install/uninstall commands used by Application Manager. This option could be used, for example, to force the Windows installer to write a verbose log file to a specified location. Additional parameters cannot be used to override the default installation commands.

All applications deployed by a deployment process where additional parameters are applied must be able to use the commands specified using this setting. We recommend creating an individual deployment process for each application that requires additional parameters, and then adding those commands to each of the newly-created deployment processes, rather than applying a global setting.

Restart Behaviour

Application Manager allows you to set the default device restart behaviour after installation.

Available options:

- Determine behaviour based on return code (default)
- No specific action
- The software install program might force a device restart
- Client will force a mandatory device restart
