# Windows Embedded Devices

Last Modified on 03.25.25

Application Manager offers an option to control the installation behavior on Windows Embedded devices on the **Deployments > Advanced** tab. By default, the **Commit changes at a deadline** option is set to **No**.

- When set to **Yes**, changes are committed at the installation deadline. A restart is required and the changes persist on the device.
- When set to **No**, changes are committed during a maintenance window. The application installs to the temporary overlay, and is committed at a later time.
