

# Application Manager System Requirements

Last Modified on 10.16.24

The following [software](#) and [network requirements](#) must be in place to successfully implement Application Manager with Recast Management Server in a Configuration Manager environment and/or an Intune environment.

## Software Requirements

- [Recast Management Server installed with Recast Proxy](#) on a system that meets [RMS requirements](#) and has the necessary [Proxy Permissions](#) for Application Manager.

**NOTE:** Prior to beginning the [initial Application Manager setup](#), both the user running the setup and the service account running the Recast Proxy require the **TaskScheduler > StartTaskByName** permission in RMS. You can grant the permission by adding it to the [default Administrator role](#), or by a creating custom role.

## Configuration Manager Integration

- Microsoft-supported version of Configuration Manager with the following set up in your ConfigMgr environment:
  - At least one Distribution Point Group
  - Collections that will be used for deployments

For instructions on setting up your ConfigMgr environment, see [Configuration Manager Setup for Application Manager](#).

## Intune Integration

- Microsoft-supported version of Intune with [Entra groups](#) that will be used for deployments

To learn how to configure your Intune environment, see [Intune Setup for Application Manager](#).

## Network Requirements

### Disk space

SMB network share for storing downloaded application installer with at least 50GB of free disk space.

### Internal Network Communication

Application Manager for MECM uses WMI queries to communicate with the Configuration Manager Site Server. The WMI queries use RPC protocol over TCP/135.

For more information, see [Ports used for connections - Configuration Manager | Microsoft Learn](#).

## External Domains

### **MECM and Intune Integrations**

Application Manager checks for new application versions over the Internet and downloads application media from Azure using the HTTPS protocol over TCP/443.

Recast Management Server and Recast Proxy require outbound access to the following external domains:

Application Manager Enterprise

- <https://amprod02.recastsoftware.com> - to access the application catalog
- <https://amprodpub02.recastsoftware.com> - to download application media and icons

Application Manager Standard

- <https://amprod01.recastsoftware.com> - to access the application catalog
- <https://amprodpub01.recastsoftware.com> - to download application media

### **Intune Integrations Only**

For Intune integrations of Application Manager, the Recast Proxy requires outbound access to the following domains over TCP/443:

- <https://login.microsoftonline.com> - for Entra ID authentication
- <https://graph.microsoft.com> - to connect to the Microsoft Graph REST API
