RECAST SOFTWARE

Install Privileged Access

Last Modified on 08.20.25

Once you've ensured that your system meets Recast Management Server requirements, deploy Privileged Access and the required Recast components according to this implementation workflow.

Recommended workflow for Privileged Access

1. Download the following Recast components from the Recast Portal:

- Recast Management Server
- Recast Proxy, if using Active Directory or Entra ID objects to target rules
- Recast Agent

2. Install Recast Management Server with Recast Proxy.

   NOTE: The Recast Proxy must be deployed separately, after Recast Management Server installation, if the proxy is being installed on a server other than the Recast Management Server. See Install Recast Proxy Separately.

> If you've already installed Recast Management Server with a Recast Proxy for another Recast product, there's no need to reinstall RMS and Proxy to add Privileged Access.

3. Configure Recast Management Server roles and permissions for Privileged Access.

4. Set up Entra ID for Privileged Access.

5. Set up your default Privileged Access configuration.

6. Deploy Recast Agents.
