

# Install Patching

Last Modified on 08.11.25

Once you've ensured that your system meets [Right Click Tools Patching Requirements](#), we recommend deploying and configuring Patching and its Recast components according to this implementation workflow.

To install Patching, along with Insights, as add-ons to Right Click Tools, see our [Multi-Product Implementation Guide](#).

## Recommended workflow for Patching

1. Download the following Recast components from the [Recast Portal](#):

- Recast Management Server
- Recast Proxy

2. [Install Recast Management Server with Recast Proxy](#).

If you've already installed Recast Management Server with a Recast Proxy for another Recast product, there's no need to reinstall RMS and Proxy to add Patching. Just ensure that your Recast Management Server is running Recast Software version 5.4 or later, as that is the version that introduced Patching (formerly Application Manager) in RMS.

3. [Configure MECM for Patching](#), if applicable.

4. [Configure Intune for Patching](#), if applicable.

5. [Configure required permissions for the Recast Proxy](#).

6. [Configure Recast Management Server roles and permissions for Patching](#).

Once you've set up your environment and Recast Management Server for Patching, you're ready to do your [initial setup](#).
