

AM for Intune Deployment Process Supersedence Settings

Last Modified on 10.16.24

Applications Manager offers a number of settings to configure the supersedence rules around application versions.

To set supersedence options:

1. Choose to **Enable supersedence**: Default is **Yes**.

You can additionally choose to **Uninstall superseded applications before installation**: Default is **No**. Application Manager can update previous application versions without the uninstall option. The automatic task sequence update feature will not work if this option is set to **Yes**.

2. Select a **supersedence method**:

- **All previous versions** (default): Supersedes all previous versions that aren't removed
- **Previous version**: Supersedes only the previous version

3. Choose a **Maximum Allowed Runtime**: Set Hours and/or Minutes (cannot exceed 12 hours)
