Application Workspace 4.3.4147 & Earlier

Last Modified on 2026-09-28

4.3.4147

Bugfix

Graphmail updated to Microsoft's version 2 endpoints.

4.3.4014

Change

Support for Microsoft Entra ID in national clouds.

4.3.3979

Change

Added logging for web window in the userhost log.

Bugfixes:

- Improve page info fetcher.
- PowerShell module could not be used in external projects.
- Application Workspace system tray icon not visible in user session.

4.3.3944

Change

Added ability to add and update Microsoft Graph mail servers through PowerShell.

Bugfixes

- No icon information returned for package shortcuts in PowerShell.
- Device registration with device registration certificate can fail in some circumstances.

4.3.3930

Changes

- Support CIM for Universal Agent virtual disks actions.
- Setup Store shortcut will no longer lose user settings after the package is updated. This change will take immediate effect for all Setup Store customers when using the latest version of a software title.
- Azure Entra ID identity source Teams integration page will display a warning for missing domain hint and Token

Exchange authentication method not being enabled.

Bugfixes

- Microsoft Store connector doesn't detect updates. This fix will cause a one-time update for all synchronized packages.
- System.NullReferenceException can occur while creating or browsing connector resources.
- Sensitive data is not always masked in the audit log.
- Unable to update a deployment action through the PowerShell module.
- Dal_Duplicate error on ZoneContents could occur while adding content.
- Setting up the Teams integration fails directly after changing the Entra ID domain hint or Token Exchange Application ID URL.

4.3.3916

Bugfixes

- 'Access policy' was misspelled in some areas of the user interface.
- The Application Workspace Browser could have multiple process instances for a single user.
- Some properties from EntraID were not displayed in the User Information page.
- Sending emails through Microsoft Graph API was not possible.
- Auditing data did not show the correct ID of the object in some cases.
- Not all package versions were listed in the dependencies view.
- Auditing data did not contain information about the removed object from a collection.
- Privileges assigned through User Collections were not evaluated.
- Launcher show packages which require an agent as disabled.

4.3.3902

Bugfixes

- When a user collection is targeted within an entitlement and the publish option is changed, the 'Native Icons' option disappears.
- Updating existing macOS applications with an archive installer (tar, dmg etc.) will break the application.

4.3.3893

Bugfixes

- Excerpt is not always shown in the catalog.
- Unable to retrieve operators in the Get-LiquitFilter PowerShell cmdlet.
- 'Manage package' option is available when in embed mode.
- Improved reliability for exchange token authentication method.

4.3.3874

Bugfixes

- User logout/device shutdown is delayed longer than needed.
- Application Workspace server can generate a 500 HTTP error when using Safari with a portal integration.

- Direct access is not working when using 'Generate SAS' as authentication.
- Unable to import elliptic-curve certificates.

4.3.3861

Bugfixes

- Application Workspace browser Browser can fail to start.
- Special characters in package shortcut name can result in stuck loading animation in the Workspace tab.
- Documentation button doesn't work on diagnostic report pages.

4.3.3851 (Major Release)

> **Upgrade guide**
> Before upgrading from version 4.2 to version 4.3, we recommend reading the Upgrade from version 4.2 to version 4.3 guide.

Rebranding

Liquit Workspace is now Application Workspace. It has a new look and the display name of services was changed to reflect the new name.

Microsoft Teams Integration

You can easily implement Microsoft Teams integration to allow end users to access their apps and resources straight from Teams, improving processes and simplifying your delivery strategy. For more information, see Application Workspace for Microsoft Teams. The integration can be made manually or through a wizard.

Diagnostic report

A new feature called **Diagnostic Report** was added. End users can send a message to admins with the description of an issue they encounter, by using the new Submit diagnosis option that is available in the User Portal. Application Workspace automatically
attaches relevant diagnostic information to the report.
If you have an email configured, the system also sends you an email with the description and a link to a zip file containing: device, network, user, server information and Log files (Agent.ljson/Agent.log/UserHost.log).
For more information, see Diagnostic Reports and User Portal.

New Time zone filters

Group devices and users by their time zone to match their location and manage package updates efficiently, reducing high loads. For more information, see Package filters and Context filters.

Microsoft Graph API email server

Application Workspace makes now possible to authenticate to Microsoft 365 by using the Microsoft Graph API instead of SMTP basic authentication. For more information, see Configure the Microsoft Graph mail server.

Improved logging for connection via satellite

Recast

Whenever the Application Workspace Satellite Server encounters an error, the error message will show the origin of the error. Both the Application Workspace Server and the Application Workspace Satellite Server should be upgraded to Application Workspace 4.3.

Wait for a zone while in a deployment

If the connection to the zone is lost during a deployment, the Agent will wait for a set period of time until the zone becomes available again. For more information, see Agent Configuration and Agent Settings.

Display name length limit increased

The character number limit for a package's display name and shortcut name has been increased to accommodate more than 50 characters.

VMware Horizon connector renamed as Omnissa Horizon

The VMware Horizon–Connector was renamed Omnissa Horizon to reflect the official rebranding.

Extended support for other macOS app formats

The number of app formats supported by the Application Workspace Agent for macOS was extended ensuring efficient file management and compatibility with various archive types. The following versions are supported:

- pkg
- mpkg
- dmg
- zip
- tar
- tar.gz
- tar.bz2
- tar.xz
- tgz
- txz
- gzip
- bzip2
- tbz2

Bootstrapper

Legacy bootstrapper download option removed

The `/legacyDownload` option is no longer present in the bootstrapper, removing the option to download the Liquit Workspace Agent.

Application Workspace Powershell Module

The performance of the Export-LiquitContent cmdlet has been improved.

Support lifecycle

The following components have reached end-of-life:

- Versions 3.x of the Agent
- The Agent Bootstrapper Legacy (Windows)
