Backup and Restore

Last Modified on 2026-09-28

Backup

The following (data) directories are required for a successful backup of an Application Workspace Server:

Name	Default Path
Configuration	`C:\Program Files (x86)\Liquit Workspace\Server\Server.json`
Content Store	`C:\ProgramData\Liquit Workspace\Server\Content`
Agent configurations	`C:\ProgramData\Liquit Workspace\Server\Agents`

We recommend you backup the Application Workspace database before backing up the servers, because the Content Store on disk and in the database are interconnected.

Restore

Restoring the database

1. Shut down all Application Workspace Servers.
2. Restore the Application Workspace database.
3. Start all Application Workspace Servers.
4. Run Verify content on every server within the Application Workspace System.

Restoring a server

1. Restore all data directories specified in the Backup section of this article.
2. Run Verify content on the restored server within the Application Workspace System.
