Content Store Overview

Last Modified on 2026-09-28

The Content Store contains all icons, background images, folders, scripts, setup files etc. that are uploaded to the Application Workspace Server.
Application Workspace uses deduplication / single instant storage of content items in the backend. Files that are uploaded to the Content Store will automatically use Application Workspace's built-in deduplication feature. This feature works across the zone for increased storage efficiency.
Content will be replicated across all Application Workspace Servers known to a particular database to enhance content accessibility.

The location of the Content Store is `C:\ProgramData\Liquit Workspace\Server\Content` on each server.
