Remove the HTTPAPI/2.0 Header

Last Modified on 2026-09-24

Application Workspace uses the HTTP.sys web server of the Microsoft Windows operating system for handling the incoming HTTP(s) requests.

The web server will automatically add "server: Microsoft-HTTPAPI/2.0" to every response. As a security best practice, you should avoid incorporating server headers within the response payload.

> The HTTP.sys web server is used by multiple applications on the same server. For example, Microsoft IIS.
> The changes described below will affect any application that is using this web server.

To remove the server header:

1. Navigate to the `HKEY_LOCAL_MACHINE\SYSTEM\CurrentControlSet\Services\HTTP\Parameters` registry key folder.
2. Create a registry key with the following properties:
    - Type *REG_DWORD*
    - Name *DisableServerHeader*
    - Value *2*
3. Reboot the server, so that your changes will take effect.

For more information, see Microsoft documentation.
