

## Install uploaded Windows App

Last Modified on 04.16.26

The *Install uploaded Windows App* action allows you to upload a Windows application to the Content Store and install the application on devices from the content repository.

### General

**Type** *Install uploaded Windows App*

**Name** Actions are easier to comprehend and manage over time when they have a suitable name that accurately expresses what they do.

**File** Select the msix/msixbundle/appx/appxbundle file which needs to be installed.

### Advanced

**Context** The level at which the action is executed, *User* or *Device*.

### Stage

**Windows** If this option is selected, the necessary files for the Windows app are copied to devices.

### App

**Register** Register the (staged) Windows App to the device; when **User** context is selected, it will only register the

**Windows** Windows App for the current users on devices, when **Device** context is selected, the Windows App will be registered to all users on devices.

### Fetch

**content on demand** If this option is selected, the content is downloaded only when the action is being executed; the content is not prefetched at the distribution stage.

The action won't execute if both **Stage Windows App** and **Register Windows App** are disabled.

### Filters

Here you can define conditions which determine if the action will be executed. For more information, see [Filters](#).

**Agent**  
It requires the Agent to be running.
