

Reboot

Last Modified on 04.16.26

The *Reboot* action allows you to perform a reboot on devices. If this action is used during deployment, the deployment will continue with the next action or package after reboot.

After a deployment runs, the device needs a reboot to get the Agent out of the running deployment state. The Agent configuration file is reverted to the previous state. The Application Workspace Launcher is not available while deploying.

General

Type *Reboot*

Name Actions are easier to comprehend and manage over time when they have a suitable name that accurately expresses what they do.

Timeout The time in seconds to wait before a reboot.

Filters

Here you can define conditions which determine if the action will be executed. For more information, see [Filters](#).

Agent
It requires the Agent to be running.
