

## Set variable

Last Modified on 04.16.26

The *Set variable* action allows you to dynamically change an existing Application Workspace variable or create new ones.

The resulted variable exists only temporarily until the action is executed; it is not saved anywhere, and it is displayed only in the package you configured it. After the action is executed, the variable is discarded.

### General

**Type** *Set variable*

**Name** Actions are easier to comprehend and manage over time when they have a suitable name that accurately expresses what they do.

**Variable** The name of the Application Workspace variable.

**Value** The value of the Application Workspace variable.

**Sensitive** If this option is selected, the variable is not logged in the log file and it is hidden on Application Workspace UI.

### Filters

Here you can define conditions which determine if the action will be executed. For more information, see [Filters](#).

#### Agent

It requires the Agent to be running.

## Supported platforms

### Platform Supported

Web No

Windows Yes

macOS Yes
