

Mac App installed version

Last Modified on 04.16.26

Use *Mac App installed version* to filter based on a specified version of a Mac application installed on devices.

General

Type *Mac App installed version*

Bundle name The name of the bundle, e.g. the part in the directory name before ".app". For example, for the Liquit Universal Agent for Mac ("Liquit.app"), it will be "Liquit".

Compare *Equal, Not equal, Greater than, Less than*

Version For example 1.0.0.0

Use short version If this checkbox is selected, the filter will check the short version string rather than the long version string in the `.plist` file. This option is useful when the file contains errors like missing long version or the short version is different than the long one.

Advanced

Context The level at which the action is executed, *User* or *Device*

Agent

It requires the Agent to be running.
