Recast

Package installed

Last Modified on 2026-04-16

Filter according to whether a dependent package was installed on devices, and if the latest or previous releases were installed.

NOTE: This filter requires a running agent.

General	
Type	*Package installed*
Package	Package to check if it has been installed on the local device.
Installed state	• **Latest release** checks if the latest known version of the dependent package was installed on devices. • **Any release** checks if any release of the dependent package was installed on devices. • **Not installed** checks if the dependent package is not installed on devices. **NOTE**: The dependent package is not required to have an 'Install' type of action set or action configured. You can make any type of configuration that installs the dependent package.

The **Package installed** filter checks the internal Application Workspace package version not the vendor's application version.
