Application Workspace Connector

Last Modified on 2026-09-28

Using the Application Workspace connector, you can establish a connection to another Application Workspace zone and import applications as ready-to-use applications in the current zone. This allows you to create and test applications in one Application Workspace System and easily distribute them to other Application Workspace Systems.

Prerequisites

In the source Application Workspace zone, you need an identity source.

The identity source can be:

- the default LOCAL one
- an LDAP/Entra ID one you create – these identity sources must have the**Form authentication** method enabled and must not have multi-factor authentication configured.

Configure an Application Workspace Connector

For more information about the **Overview**, **Entitlements**, **Synchronization Profile**, **Releases** and **Managed packages** screens, see Overview.

> **Resources**
> The resources displayed in **Overview** > **Resources** are those assigned directly to the account set up for the connector (**Settings** > **Username**) but also those assigned via contexts, groups or user collection.

Settings tab

- **URL** –The zone from which the applications should be imported.
- **Username** – The username which will be used to import the applications, in the following format: `LOCAL\username` .
- **Use NTML authentication** – Allows you to enable the NTML authentication for the current connector.
