

Dashboard

Last Modified on 2026-05-29

Application Workspace dashboards can help you discover and resolve issues surfaced by continuous and proactive monitoring of the applications, devices and users within your Application Workspace System.

Prerequisite

To access dashboards, you first need to enable the [Reporting](#) functionality. Remember that after configuration, it can take up to 24 hours for information to appear in the dashboard.

Available Dashboards

By default, the following dashboards are available:

- **User events** – Displays all events related to the users, how many users accessed Application Workspace and if access failed why it did.
- **Application events** – Find out what are the most used applications within your Application Workspace System, how many applications have been deployed, installed and launched and whether or not this was successful. If you click on one of the status tiles, a detailed screen will open.
- **Applications** – Displays a list of all applications deployed via the Application Workspace Server. This screen makes it easy to identify potential issues with applications.
- **Devices** – Displays all available information regarding devices connected to your Application Workspace Server.
- **Event details** – Displays all events recorded on the Application Workspace Server.

For more information about elements of the dashboards and how to interact with them, see [PowerBI documentation](#).
